The construction process involves several steps including building foundations, setting structures and stringing conductor. We will work with landowners to keep them informed during each step of the process.

Polymer and wood mats may be installed in wet or soft areas to prevent compaction and minimize soil disturbance.

Crews drill into the ground prior to setting a structure.

A casing is put into place as a foundation is built.

Crews set a structure using a direct embed technique. Some structures will require concrete foundations.

Crews clip line after stringing the conductor.

Following construction, the right-of-way is cleaned up and restored.
